FEATURE 01 OF 14 | PRIORITY P0

Message Input

Priority	P0
Judging criteria served	Completeness (35) | UI/UX (15)
Estimated effort	Small (~1-2 hrs) (rough estimate)
Depends on	None - this is the entry point

Purpose

The message box is where every demo starts. If pasting a message and pressing one button is not effortless, nothing else gets a chance to impress the judges. The goal: from opening the app to seeing a result in under 10 seconds, with no sign-up.

What it must do

- Large multi-line text area that accepts pasted SMS, email or chat text (plain text only).
- Primary **Analyze** button, plus **Try example** and **Clear** buttons.
- Live character counter with a 5,000 character limit; text beyond the limit is rejected with a visible notice (never silently cut).
- Empty or whitespace-only input shows a friendly inline message under the box - no browser alert() pop-ups.
- Keyboard shortcut Ctrl/Cmd + Enter runs the analysis.
- No account, login or consent wall before the first scan.
- A one-line privacy note under the box, e.g. "Your message is checked in your browser and is not uploaded" (only true if rules run client-side - see Design).

How it should work

- **Keep the original text untouched.** All highlight positions (feature 5) are character offsets into the exact string the user pasted. Never run the rules on a lowercased or reformatted copy whose length can differ from the original; use case-insensitive regular expressions on the original instead.
- Normalise only for matching, not for display: trim leading/trailing spaces and convert look-alike Unicode (full-width letters, odd spaces) with NFKC where it does not change string length, or map offsets back to the original.
- Treat input strictly as text. When rendering it back (feature 5) use text nodes, never raw HTML, so a pasted <script> tag cannot execute.
- Recommended for the MVP: run the rules engine in the browser (JavaScript). It works offline, is instant, protects privacy and cannot fail during a live demo because of network problems.

UI / UX notes

- On a phone the text box and Analyze button must both be visible without scrolling.
- Use a font size of at least 16px inside the textarea (smaller sizes make iPhones zoom the page).
- Placeholder text shows what to paste: "Paste the SMS, email or WhatsApp message you received...".
- After analysis, keep the original box visible but collapsed so the user can edit and re-run.

Edge cases and risks

- Very short text (under about 10 characters): show "Not enough text to analyse" rather than a misleading Low score.
- Hindi / Hinglish messages: MVP rules are English-first. Show a gentle note when most characters are non-Latin: "Hindi support is coming; results may be incomplete."
- Pasted HTML or links with tracking junk: treat as plain text, do not strip links.
- Text containing emoji or zero-width characters: must not break offsets or crash the highlighter.

Acceptance tests

Try this	Expected result
Click Analyze with an empty box	Inline message "Paste a message first"; no result shown; no crash
Paste 6,000 characters	Notice that the limit is 5,000; analysis does not run until fixed
Paste the example, press Ctrl+Enter	Result appears exactly as if Analyze was clicked
Paste text containing <script>alert(1)</script>	Shown as literal text; nothing executes
Use a 360px wide phone screen	Box and button visible without horizontal scroll

Demo tip for the judges

> Open the app, click Try example, press Analyze. Three seconds, one click - this is the 'Completeness' moment the judges are waiting for.
