FEATURE 07 OF 14 | PRIORITY P0

Safe Next Steps

Priority	P0
Judging criteria served	Completeness (35) | UI/UX (15)
Estimated effort	Small (~1-2 hrs) (rough estimate)
Depends on	Rule-Based Detection, Risk Classification

Purpose

Detection is only useful if the user knows what to do next. This feature converts the fired rules into short, specific, ordered actions. A result without next steps is incomplete from the user's point of view.

What it must do

- Show 3-5 action steps, ordered by importance, based on which rules fired and the risk level.
- Every step is a clear instruction starting with a verb (Do not..., Call..., Report...).
- A general set always appears for Medium/High (do not click, do not reply, block the sender).
- A 'Already shared something?' section shows urgent steps if the user has replied, clicked or shared an OTP/PIN.
- Verification advice never relies on contact details inside the suspicious message.

How it should work

- **Rule-to-action mapping (stored in config):**
- OTP/PIN/password request: "Never share OTPs, PINs or passwords - no bank or company needs them from you."
- Suspicious link: "Do not tap the link. If you need to check your account, type the official website yourself or use the official app."
- Account threat / urgency: "Real banks do not block accounts through SMS links. Call the number printed on your card or on the bank's official website."
- All High/Medium: "Block the sender and delete the message after reporting it."
- **If already shared (India):** call your bank right away using its official number to block the card/account; report financial fraud on the national cyber-crime helpline 1930 and at cybercrime.gov.in; suspicious calls/SMS can also be reported through the Government's Sanchar Saathi portal. (Confirm these contact details are still current before your demo.)
- Keep wording calm and non-technical. No blame language.

UI / UX notes

- Numbered checklist with large tap targets; steps can be ticked off.
- The urgent 'Already shared?' block is a distinct, visually prominent card, but not alarmist.
- Phone numbers are tap-to-call on mobile.

Edge cases and risks

- Low result: show gentle general tips ("Verify unexpected requests") instead of alarming steps.

- No rule matches a specific action: fall back to the general set.
- Do not recommend actions that could cause harm (e.g. calling a number found in the message).

Acceptance tests

Try this	Expected result
Example message (OTP + link)	Steps include 'never share OTP' and 'do not tap link'
Benign message	Only light general tips
Click 'I already shared my OTP'	Urgent bank + helpline steps appear first
Mobile	Helpline number is tap-to-call

Demo tip for the judges

> After the high-risk result, scroll to 'What should I do now?' - judges see the product helps the user act, not just detect.
