FEATURE 10 OF 14 | PRIORITY P0

Mobile-Responsive Design

Priority	P0
Judging criteria served	UI/UX (15) | Completeness (35)
Estimated effort	Medium (~3-4 hrs, mostly polish) (rough estimate)
Depends on	All UI features

Purpose

Most scam messages arrive on phones, and the people most at risk mostly use phones. The full flow - paste, analyse, read result, act - must be comfortable on a 360px screen. This is also the easiest way to score UI/UX points.

What it must do

- Design mobile-first: 360px is the base layout, then enhance for tablet (768px) and desktop (1280px).
- No horizontal scrolling at any width from 320px up.
- Touch targets at least 44 x 44 px.
- Body text at least 16px; inputs 16px or larger.
- Result order on mobile: level + score, highlighted message, explanation cards, next steps.
- Meets WCAG AA contrast (4.5:1 for body text) and works with keyboard and screen readers.

How it should work

- **Style direction (matches your preferred dark, simple, luxury look):** near-black background, warm off-white text, a single gold accent, generous spacing, one serif display font for headings and a clean sans for body. Keep the number of colours small; reserve green/amber/red for risk levels only.
- Layout: single column container, max width about 720px on desktop, centred; cards with soft borders instead of heavy shadows.
- Use CSS flexbox/grid with relative units (rem, %) and a viewport meta tag; avoid fixed pixel widths.
- Sticky bottom 'Analyze' bar on mobile when the keyboard is closed; hide it when results are showing.
- Support prefers-reduced-motion and prefers-color-scheme; a dark theme is the default.
- Run Lighthouse (Chrome DevTools) and target 90+ in Accessibility and Performance.

UI / UX notes

- Test physical devices if possible; at minimum Chrome DevTools device mode at 360, 390, 768, 1280.
- Use skeleton/loading states even if analysis is instant so the UI feels deliberate.
- Keep copy short; one idea per screen section.

Edge cases and risks

- Landscape orientation on phones: layout must not break.
- System font scaling at 150%: text must not overlap or get clipped.
- Very long unbroken URLs in the message: use word-break so they wrap instead of stretching the page.

Acceptance tests

Try this	Expected result
320px width, example message	No horizontal scroll; everything readable
Tab key through the page	Logical focus order; visible focus ring
Lighthouse accessibility	90 or above
Browser font size set to Large	No clipped text
Turn on reduced motion	No animations play

Demo tip for the judges

> Do part of the demo on an actual phone (or phone-sized window) - judges notice.
